

Developer Guide:

- Clone the git repository at:
<https://github.com/christophernixon/DevOps-Pipeline-sweng.git>
- To run the front-end, you must have npm node modules and react.js installed on your computer
- From the command line, cd into the git repository and “npm start” to run the web-application on a local server or “npm test” to test the application
- If you wanted to check if the application properly compiled into a container or to run the container locally, the commands would be “docker build” and “docker run” respectively.
- For running the end-to-end tests on the application, you have to change the baseURL in cypress.json and then run “npm run cypress:all”
